## Climate Outlook September-October 2020

## SOI TRACKER:

The monthly average SOI for August was positive 8.39 (+8.39) compared to positive $4.25(+4.25)$ ) in July. Therefore the SOI phase for August came out as "Consistently Positive".

|  | SOI VALUE | SOI PHASE |
| :--- | :---: | :---: |
| End of September 2019 | -12.72 | "Rapidly Falling" |
| End of October 2019 | -5.19 | "Consistently Negative" |
| End of November 2019 | -9.45 | "Consistently Near Zero" |
| End of December 2019 | -6.72 | "Consistently Negative" |
| End of January 2020 | 0.65 | "Rapidly Rising" |
| End of February 2020 | -2.6 | "Consistently Near Zero" |
| End of March 2020 | -6.02 | "Consistently Near Zero" |
| End of April 2020 | -0.75 | "Consistently Near Zero" |
| End of May 2020 | 2.57 | "Consistently Near Zero" |
| End of June 2020 | -9.13 | "Rapidly Falling" |
| End of July 2020 | 4.25 | "Rapidly Rising" |
| End of August 2020 | 8.39 | "Consistently Positive" |

## RAINFALL OUTLOOK

- Median rainfall for September-October at Macknade is equal to 58.3 mm .
- Based on the new SOI phase, we have calculated the chance of exceeding median rainfall for September-October for the Herbert region to be 59\%. (A 50\% chance is what would be considered the 'normal chance' of experiencing above median rainfall).
- The Upper Quartile (top quartile of rainfall) for September-October at Macknade is equal to 105.3 mm .
- Based on past rainfall events over a period of more than 110 years, the chance of experiencing excessively high rainfall (i.e. rainfall greater than the upper quartile) is equal to $44 \%$. ( $25 \%$ chance is what would be considered the 'normal chance' of experiencing excessively high rainfall.)

## Climate Outlook September - October 2020

## SEPTEMBER-OCTOBER RAIN OUTLOOK FOR INGHAM IN DETAIL:

Since 1892 when rainfall records commenced at Macknade, there have been 27 occasions when the SOI phase at the end of August was "Consistently Positive". These years were:

| 1892 | 1893 | 1900 | 1909 | 1910 | 1915 | 1916 | 1917 | 1920 | 1924 | 1938 | 1947 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 1950 | 1955 | 1956 | 1958 | 1960 | 1973 | 1974 | 1975 | 1981 | 1988 | 1996 | 1998 |
| 2010 | 2011 | 2017 |  |  |  |  |  |  |  |  |  |

During those 27 years, total rainfall for September-October exceeded the median 16 times. Therefore the chance of exceeding median rainfall for September-October is $16 / 27=59 \%$.

A high amount of rainfall (i.e. rain greater than 105.3 mm ) resulted 12 times. So the chance of high rainfall is equal to $12 / 27=44 \%$.

There have been 27 years when the SOI phase at the end of Aug was in a Consistently Positive phase (coloured Bars) In 16 of those years the rainfall during Sept-Oct exceeded the median.
The chance that the Rainfall during Sept-Oct will exceed the median $=16 / 27=59 \%$
In 12 of those years the Rainfall during Sept-Oct exceeded the Upper Quartile.
The chance that the Rainfall during Sept-Oct will exceed the Upper Quartile $=12 / 27=44 \%$

Comparison to Last Year

|  | September-October 2020 | September-October 2019 |
| :--- | :---: | :---: |
| SOI Phase | Consistently Positive | Consistently Near Zero |
| Chance of above median rainfall | $59 \%$ | $48 \%$ |
| Chance of excessively high rainfall | $44 \%$ | $19 \%$ |
